Feedback on Smriti Setu

My name is Ramakant Dalal, and I appreciate the idea behind the Smriti Setu application. As an elderly person, I sometimes find modern smartphones and applications difficult to use because of their complicated features and small buttons. Remembering different steps to send messages can also be challenging.

I found the concept of Smriti Setu very helpful because it allows users to communicate with their family members through voice messages. The simple interface, large buttons, and easy-to-understand instructions make the application more convenient for elderly people. The record, play, and send features are especially useful because they reduce the need for typing and make communication easier.

I believe this application can help elderly people stay emotionally connected with their children, grandchildren, and other loved ones, even when they live far away. Listening to familiar voices can bring happiness and reduce feelings of loneliness.

However, I would suggest making the instructions even simpler and providing support for regional languages such as Marathi and Hindi. The application should also have clear audio instructions and reliable offline playback so that users can listen to saved messages without an internet connection.

Overall, I think Smriti Setu is a thoughtful and useful initiative that can make technology more accessible to elderly people. With a few improvements, it can help senior citizens communicate independently and maintain stronger relationships with their families.

Feedback by: Mr. Ramakant Dalal

Conclusion: Smriti Setu is a promising solution for bridging the communication gap between elderly people and their loved ones through simple, voice-based technology.
